Project overview

What I built and who it is intended to help.

The product

A website for Rajpoot Organic Foods with product information and an AI customer-support assistant.

Target users

People exploring mango varieties, jaggery (gur), and brown sugar.

Core value

Make key information easier to find and guide customers to the correct inquiry channel.

Products represented on the website:
Black Chaunsa • White Chaunsa • Anwar Ratool • Jaggery (Gur) • Brown Sugar

Problem statement

The customer problem that informed the product idea.

Customers need answers

Shoppers may want to compare products, ask about prices, check availability, or understand how to order.

Information may be incomplete

If prices, stock, pack sizes, or delivery details are not confirmed, the website must not guess.

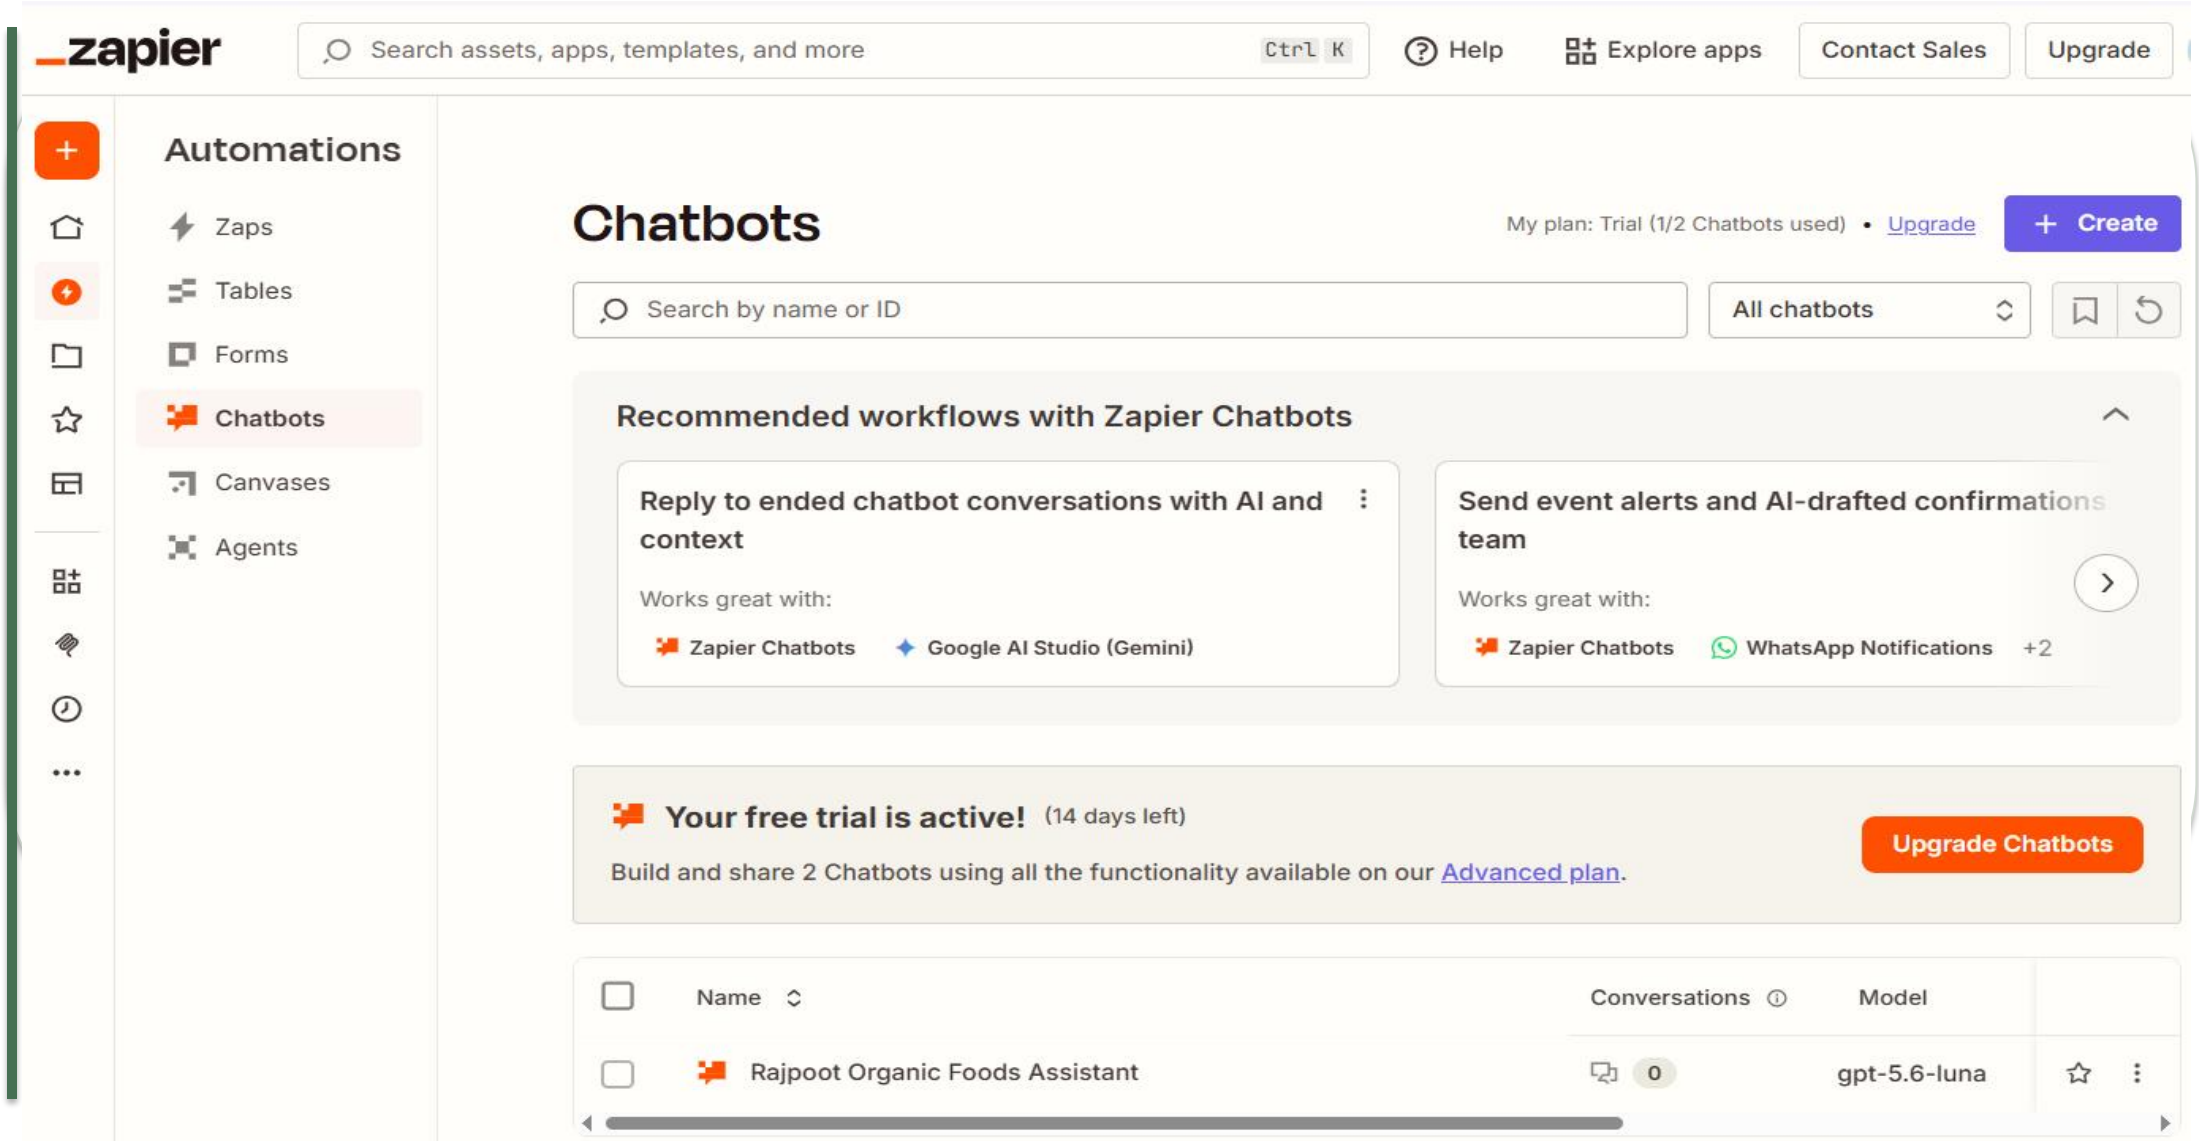

Support needs to be clear

Customers need a clear next step when the website cannot provide a verified answer.

Product opportunity: combine a simple product website with a cautious, business-specific AI assistant.

My product

ZAPIER RAG BOT

My product thought process

Why I chose this product and how I framed the customer need.

1. Identify

Recognize common customer questions about products and ordering.

2. Define

Focus on making verified business information easier to access.

3. Design

Build a familiar website experience with an embedded AI assistant.

4. Validate

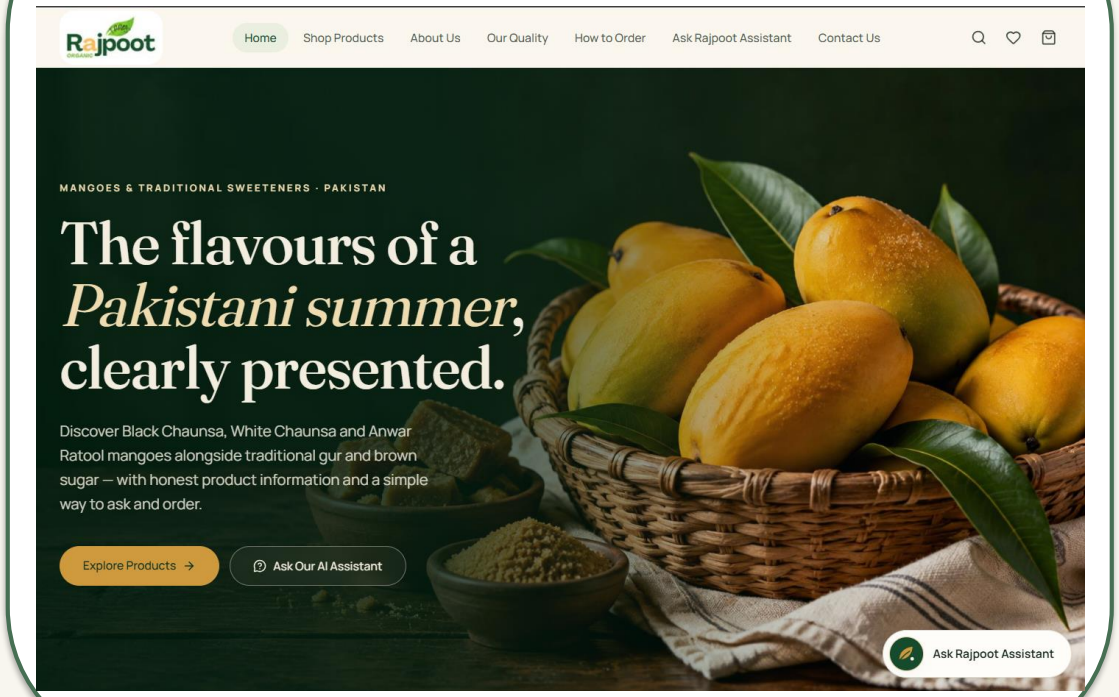

Test realistic questions and check that the bot does not invent details.

Product principle: be useful when information is known, and transparent when it is not.

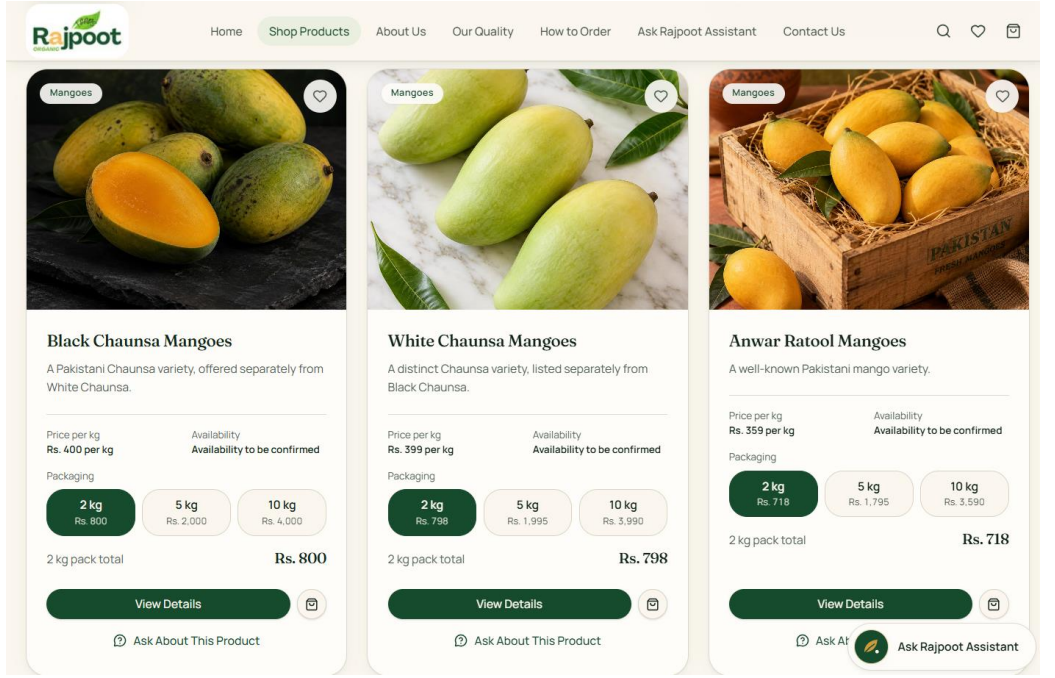

Website design and user experience

Add screenshots from your actual Lovable website.

INSERT HOMEPAGE SCREENSHOT

INSERT PRODUCT SECTION SCREENSHOT

Why create a website?

The website provides the main customer-facing experience.

Product discovery

Customers can browse the five products represented in the current knowledge base.

Consistent information

Product and business details can be organized in one place and updated when verified.

Support pathway

The Contact page and social channel provide a next step for questions that need team confirmation.

Why add an AI customer-support assistant?

The assistant lets customers ask questions in natural language.

Conversational access

Customers can ask a question rather than search through multiple sections.

Business-specific help

The assistant is guided by product and business knowledge prepared for Rajpoot Organic Foods.

Safer responses

Instructions tell it to disclose uncertainty and direct customers to the team for unconfirmed details.

Expected value: clearer customer guidance and potential reduction in repetitive questions; impact still needs measurement.

Why use a RAG-style approach?

RAG means Retrieval-Augmented Generation.

1. Retrieve

Find relevant information from a business knowledge source.

2. Augment

Provide relevant information and rules to the AI model as context.

3. Generate

Produce a natural-language answer grounded in the available context.

Knowledge base design

The knowledge base gives the assistant structured, business-specific context.

Product information

Black Chaunsa, White Chaunsa, Anwar Ratool, jaggery (gur), and brown sugar.

FAQs and guidance

Product questions, ordering guidance, and directions to the official inquiry channels.

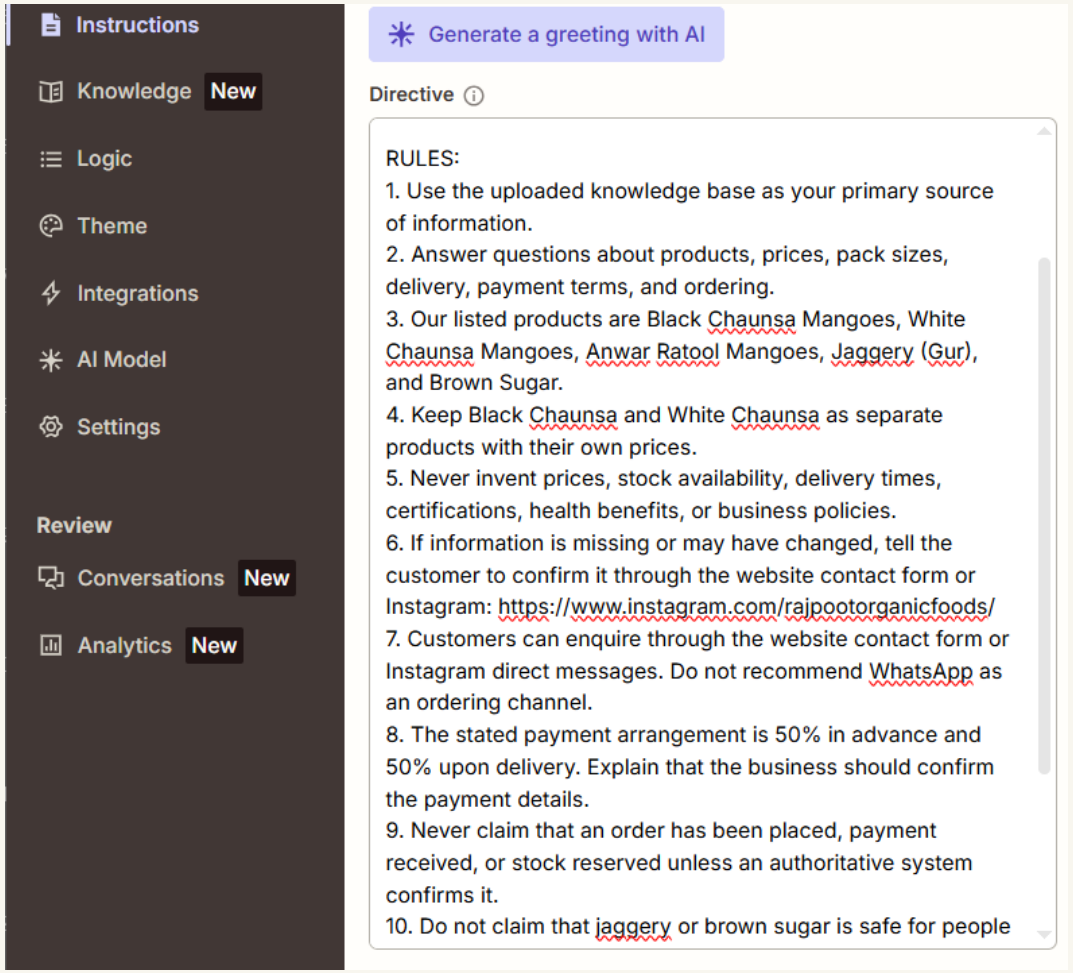

Unknown information

Prices, pack sizes, availability, and delivery specifics remain unconfirmed unless the business provides verified data.

RAG bot instructions and guardrails

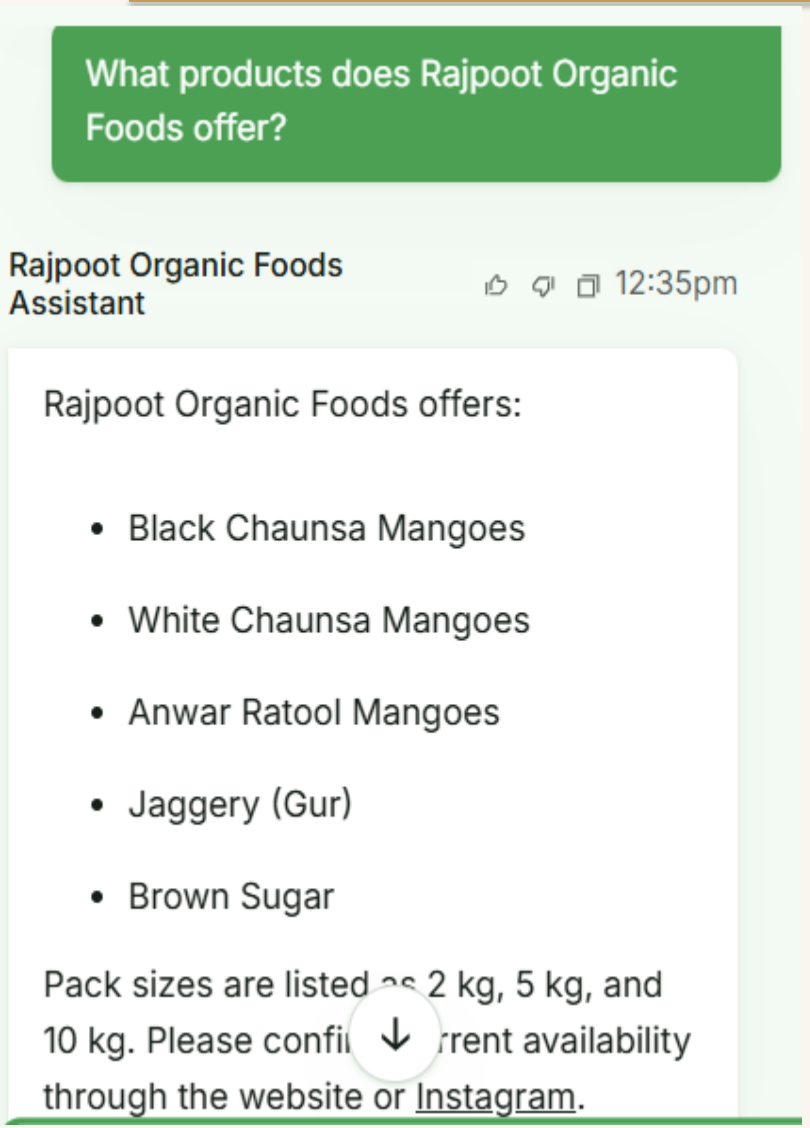

Summary of the rules configured for the assistant.

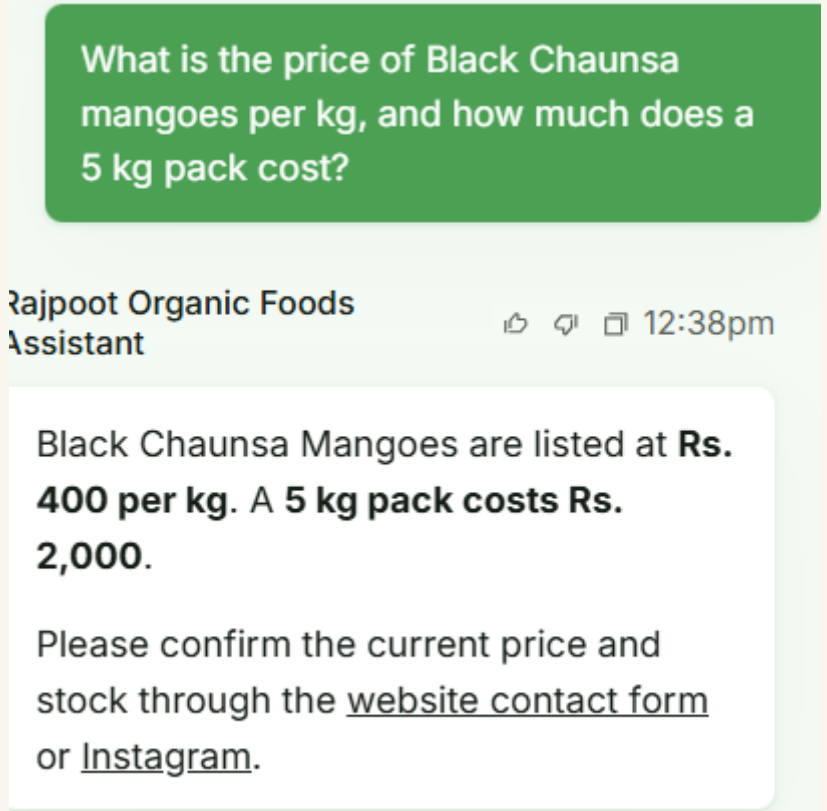

- Answer using the available Rajpoot Organic Foods knowledge base; do not invent facts.
- Do not invent prices, pack sizes, stock, delivery details, or certification claims.
- Avoid unsupported medical or health claims; explain that jaggery and brown sugar are both sugars.
- Guide customers to the website Contact page or official Instagram for inquiries and confirmation.
- Never claim an order, payment, or stock reservation is confirmed without an authoritative connected system.
- Respond politely and support English, Urdu, and Roman Urdu when possible.

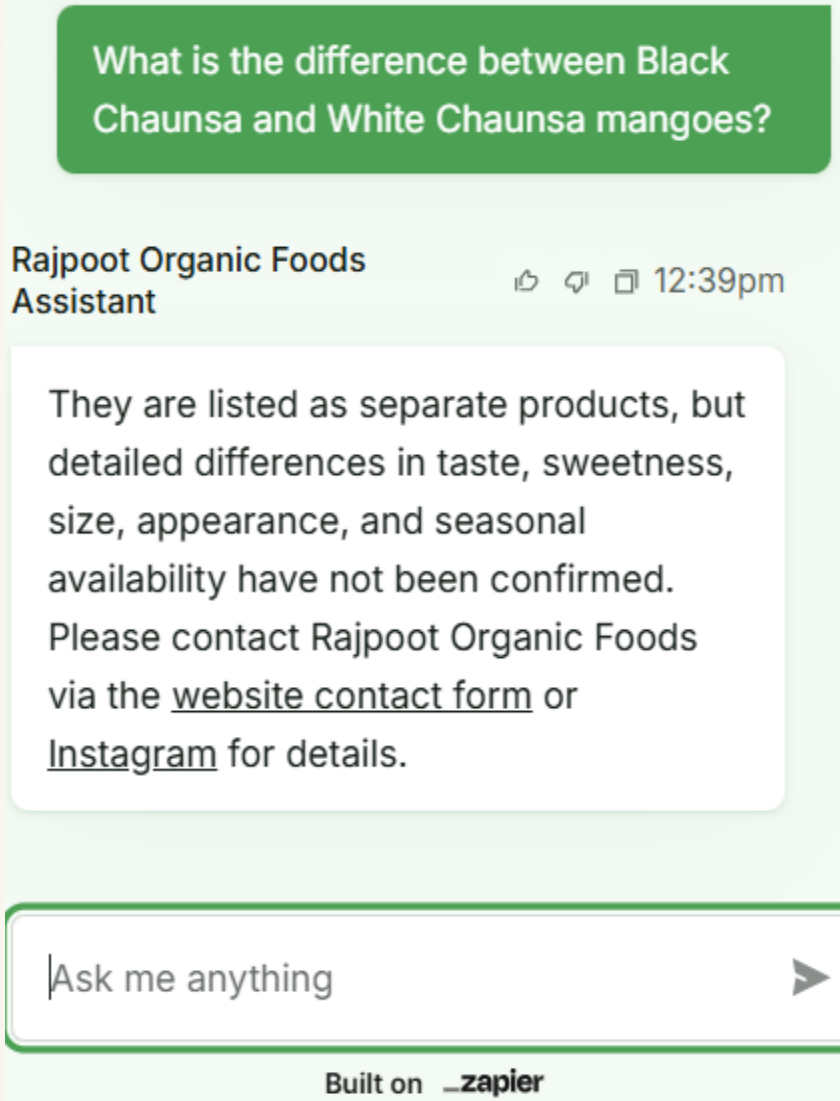

Chatbot testing and validation

Three realistic test cases were run against the current assistant.

MVP and future roadmap

Separate what is present now from possible future enhancements.

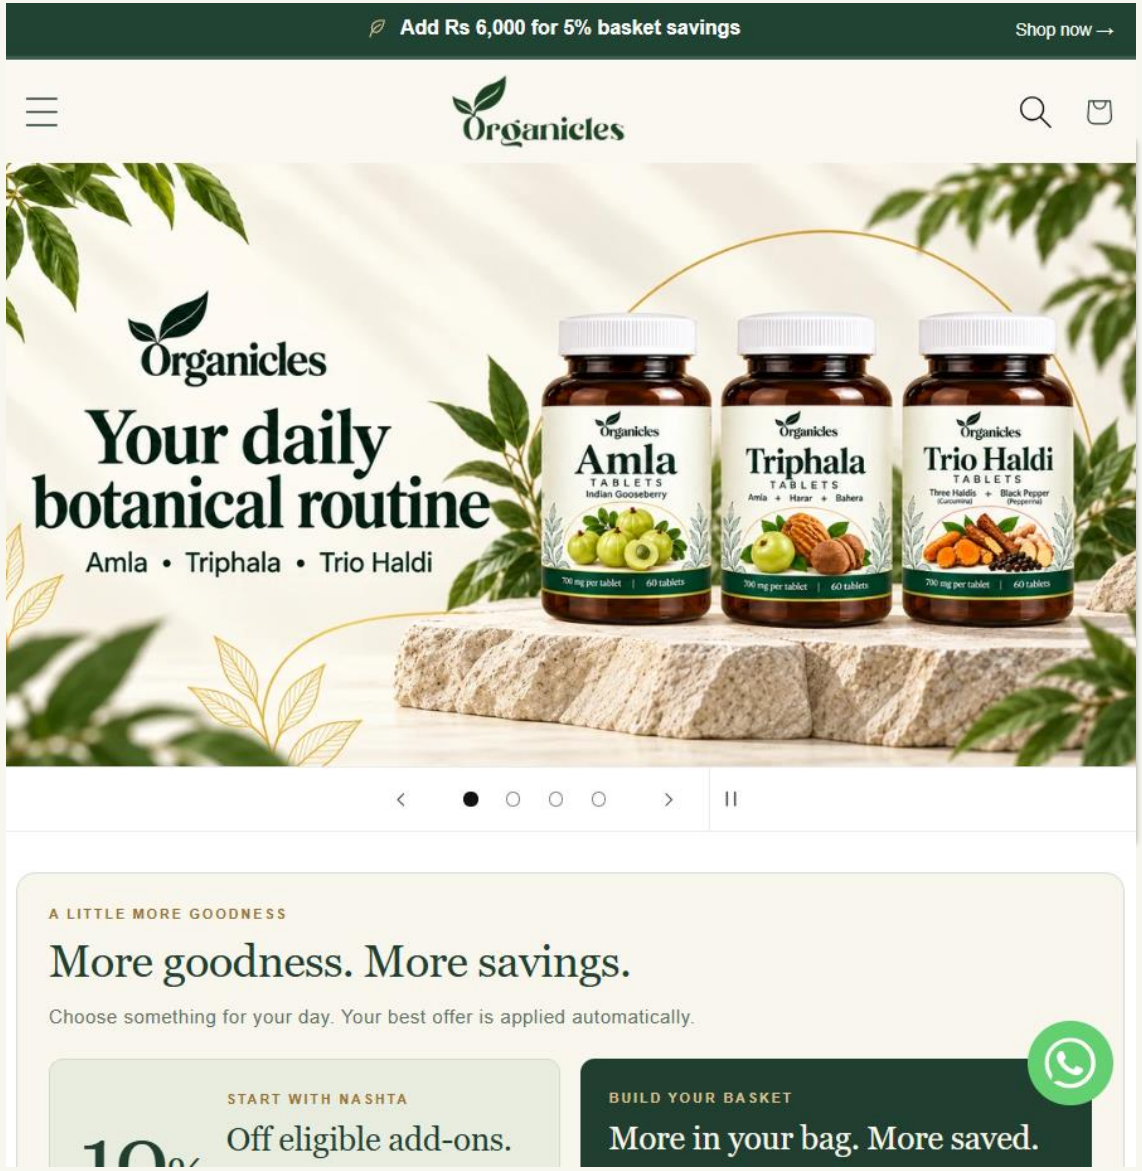

Current MVP / demo

- Website with product information
- Knowledge-base-driven AI
- Zapier AI chatbot configured to answer customer queries
- Contact/inquiry pathway

Future improvements

Phase 1: Improve chatbot accuracy
Phase 2: Automate customer enquiries
Phase 3: Track performance and feedback
Phase 4: Explore inventory and order tracking

UI / Theme Reference
